

# Let's Create! Pottery HD Lite

This cheerful app aids your creativity in the world of clay modelling without the mess, as **Rob Redman** finds out

**W**hile limited in its scope for true creativity, Let's Create! Pottery HD is an entertaining title and demonstrates what is possible with touch interface applications and the way they are integrated into our digital lives, as well as offering yet more ways to 3D print objects.

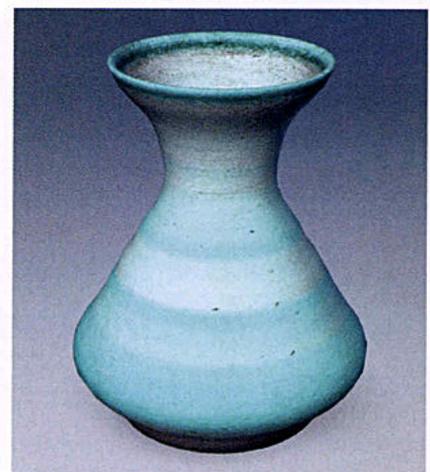

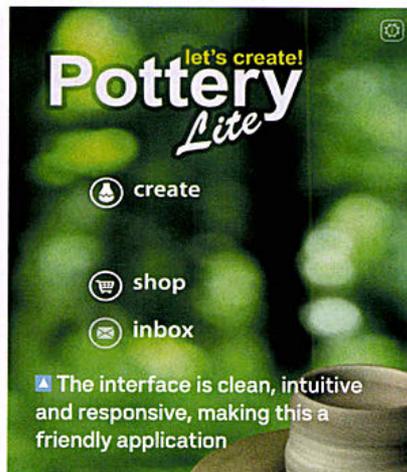

The basic premise of the app is to digitally sit at a potter's wheel, where, using a fingertip, you manipulate digital clay to shape a vase or pot. The interface works well, and the lack of options is a good thing, letting you focus on the task at hand.

Once satisfied you can bake the pot and move on to the texturing stage. The options are limited to begin with but if you work through some challenges you gain access to more, in a very game-like fashion. For the impatient, there is an option to buy textures directly.

This highlights the real nature of the app. It is very much a casual gaming experience, with some social media built in, where you can rate other people's pots and link to your Facebook account.

As a digital artist's tool, Let's Create Pottery Lite is not much more than a quick

bit of fun. However, it is well presented and the ability to have a 3D print of your finished pots directly from the app is certainly an impressive feature. At the time of going to press, I hadn't received my print but the provider, Sculpteo, have delivered good-quality prints in the past and I see no reason why this shouldn't be the same. ■

▲ The interface is clean, intuitive and responsive, making this a friendly application

## 3D WORLD VERDICT

This isn't meant to be much more than a entertainment experience, but the interface is well crafted and it's fun to use
